HYROX · BONUS GUIDE

Eating around your Hyrox training

How your nutrition moves with your training days — so you arrive fuelled and recover well.

> **Important.** This is general nutrition information, not medical or training advice. Adapt it to your own level and how you feel. With a medical condition, injury or any doubt: consult a doctor, dietitian or certified coach.

The principle

Your body doesn't ask for the same thing every day. On a **hard training day** you eat more carbs around the effort for fuel, and make sure you get protein afterwards to recover.

On a **rest day** your carb needs drop and you mainly keep your protein high. Your weekly average stays on target — you simply shift the carbs to the days you actually use them.

Timing in short

- **Before training.** Carbs in the hour beforehand. Easy to digest, not too fatty or fibrous.
- **During.** Only needed for sessions longer than ~75 minutes. For an hour's training, water is enough.
- **After training.** Carbs and protein fairly soon after a hard session help your recovery.
- **Every day.** Spread your protein across the day, not all in one meal.

The example week

A common Hyrox rhythm. Adjust the days to your own schedule.

DAY	DAY TYPE	NUTRITION FOCUS
Mon	Hard	Carbs high, recover after
Tue	Light	Moderate, protein high
Wed	Rest	Carbs lower, protein high
Thu	Hard	Carbs high, recover after
Fri	Light	Moderate
Sat	Long / race-sim	Highest carbs
Sun	Rest	Carbs lower, protein high

Example: hard training day

Before (1 to 1.5 hours ahead)

Oats with banana and whey. Easy to digest, fuel for the session.

After (within ~45 minutes)

Chicken breast with rice and vegetables, or a shake plus a full meal shortly after.

Rest of the day

Protein at every meal — quark, eggs, fish. Concentrate the carbs around your training.

Example: rest day

Breakfast

Quark with nuts and some fruit. Less oats than on a training day.

Lunch

Salad with chicken or tuna, extra vegetables, limited starch.

Dinner

Salmon or lean beef with plenty of vegetables, a small portion of carbs.

Snack

Skyr or a hard-boiled egg.

Beginner or advanced?

An advanced athlete trains longer and harder, and burns more. That means higher carb and calorie targets. A beginner keeps the portions smaller.

In the HybridFuelCo app this is calculated precisely for your own training load, so you don't have to guess.

Race week

- **2 to 3 days before.** Gradually build up your carbs and wind down your training.
- **The day before.** Familiar, easy-to-digest food. No experiments. Hydrate well.
- **Race-day breakfast.** 2 to 3 hours before, carb-rich and familiar — for example oats with banana.

The golden rule

Try **nothing new on race day**. Everything you eat and drink on the day itself, you've already tested during your training weeks.
