HYBRIDFUELCO

HYROX · BONUS GUIDE

Fueling your Hyrox training

Your body doesn't ask for the same thing every day. This guide shows how your nutrition moves with your training and rest days — so you arrive stronger, recover better and get more from your week plan.

Bonus with your HybridFuelCo week plan

General nutrition information, not medical or training advice. Adjust it to your level and feel. With any condition, injury or doubt: consult a doctor, dietitian or certified coach.

THE PRINCIPLE

Why you don't eat the same every day

A hybrid athlete trains strength and endurance. Some days demand far more energy than others. Instead of eating the same every day, you let your nutrition **move with** your training.

The core is simple: **keep protein and fat roughly constant every day; let carbohydrates swing.** On a hard training day you eat more carbs around the effort — that's your fuel and it speeds recovery. On a rest day you need less of that fuel, so carbs drop and calories with them.

Across the week you land exactly on your goal, while having energy when it counts. This is called **carb cycling**, and it's precisely what the HybridFuelCo app calculates for you.

> **REMEMBER THIS**
> Protein = the constant (muscle retention and recovery). Carbs = the variable (fuel around training). Fat = steady, for hormones and satiety.

Why does this beat eating the same every day? Because you place the calories where your body uses them. You train with a full tank, and on rest days you give your body recovery plus a slight deficit — without feeling starved on the days you need to perform.

THE TWO DAY TYPES

Training day and rest day side by side

Here's the difference in practice. Same protein base, a different carb split.

TRAINING DAY

More carbs, around the session

BREAKFAST
Oats with banana and whey, or wholegrain bread with eggs. Solid, for fuel.

AROUND TRAINING
Concentrate carbs before and after. This is the moment.

DINNER
Chicken with rice or potato, plenty of veg. Replenish and recover.

SNACK
Quark or skyr with fruit. Protein stays high.

REST DAY

Fewer carbs, protein unchanged

BREAKFAST
Quark with nuts and some fruit. Less oats than on a training day.

LUNCH
Salad with chicken or tuna, extra veg, limited starch.

DINNER
Salmon or lean beef, lots of veg, a small portion of carbs.

SNACK
Skyr or a handful of nuts. Protein to the last.

PROTEIN IS THE THROUGHLINE

On both days, protein at every meal — quark, egg, fish, lean meat. That's what protects your muscle, whether you train or rest.

TIMING

Before, during and after the session

What you eat matters, but on training days when you eat it makes a real difference to performance and recovery.

BEFORE — 1 TO 1.5 HOURS PRIOR

A carb-rich, easily digestible meal with some protein. Oats with banana and whey is a classic. Avoid a lot of fat and fibre right before a hard session — they sit heavy.

DURING — ONLY FOR LONG SESSIONS

Under an hour? Water is enough. Longer or very intense? Fast carbs (sports drink, a gel, or a few dates) help you hold your pace.

AFTER — WITHIN ~45 MINUTES

Combine protein and carbs: chicken with rice and veg, or a shake plus a full meal shortly after. This kick-starts recovery and refills your stores for the next session.

> **PRACTICAL**
>
> No time for a meal after training? A shake with some fruit bridges to your real meal. Something beats nothing in that window.

Listen to your body too. Feeling heavy at the start? Move your pre-meal earlier or make it lighter. This guide sets the direction; your own feel fine-tunes it.

PROTEIN, RECOVERY & 40+

Why protein is your foundation

Past 40, your body recovers a little slower and breaks down muscle faster when protein runs short. That's exactly when protein stops being a side note — it's your foundation.

Aim for roughly **1.8 to 2.2 grams of protein per kilo of bodyweight per day**, spread across your meals. Not all at once in the evening, but a solid portion at every meal — around 30 to 40 grams each. Your body uses it most efficiently that way for recovery and muscle retention.

- **A protein source at every meal:** quark, skyr, egg, fish, chicken, lean beef, or plant-based (tofu, legumes, soy).
- **Around training:** protein afterwards speeds recovery. Combine it with carbs.
- **Before sleep:** a slow protein source like quark helps your muscles recover overnight.

> **40+ SPECIFIC**
> Sleep and recovery matter more than at 25. Enough protein, enough sleep, and not cutting too aggressively (max ~1% of bodyweight per week) keep your muscle and strength intact.

FLUIDS & ELECTROLYTES

Drinking: simple but underrated

Even a few percent of fluid loss costs strength, endurance and focus. For Hyrox — long and sweaty — drinking isn't a detail.

The basics: spread your fluids across the day instead of all at once. A rule of thumb is around **30 to 35 ml per kilo of bodyweight** per day, and more on hard training days and in the heat.

- **Before training:** don't start thirsty. Sip steadily in the hours before.
- **Long or sweaty sessions:** add electrolytes (sodium especially). Water alone when you sweat a lot can actually leave you flat.
- **Afterwards:** rehydrate with some salt — a pinch in your food or an electrolyte drink.

> **CHECK**
> Pale-yellow urine = well hydrated. Dark = drink more. Simple and reliable.

RACE WEEK

The days around your Hyrox

In the final days before your race you don't gamble with nutrition — you make it calm and predictable. No experiments.

2 TO 3 DAYS BEFORE

Build your carbs up gradually and taper your training. You top up your stores without feeling full or heavy.

THE DAY BEFORE

Familiar, easily digestible food. Nothing new. Drink well and mind some extra salt.

RACE-DAY BREAKFAST

2 to 3 hours before: carb-rich and familiar — oats with banana, for example. Enough to run on, light enough not to sit heavy.

DURING THE RACE

Water, and on a long race some fast carbs if you feel your pace dropping. Train this beforehand — use nothing new on the day itself.

> **GOLDEN RULE**
>
> Nothing new on race day. Everything you eat and drink you've already tested in training.

IN SUMMARY

7 mistakes & your quick checklist

The most common mistakes among hybrid athletes — and a checklist to hold it all together.

1. **Undereating.** Most active 40-plus athletes sit chronically below maintenance. It costs muscle and recovery.
2. **Cutting too aggressively.** Faster than ~1% per week costs strength. Patience wins.
3. **Skipping protein at breakfast.** Protein belongs at every meal, not just the evening.
4. **Missing the recovery window.** Eating nothing after a hard session slows your recovery.
5. **Water only when sweating hard.** Without electrolytes you end up flat.
6. **Experimenting on race day.** New food is a gamble you don't want to take.

Let the app do the maths

This guide is the **why**. Your personal week plan in the HybridFuelCo app is the **how** — calculated to your weight, goal and training days, down to the gram. Together you arrive trained and finish strong.
